

## CLEANING THE FACIAL INTERFACE

Cleaning the silicone-topped facial interface of the Pico G2 4K is vital when a single headset is being utilised by multiple users. Thankfully, cleaning an Pico G2 4K headset is simple.

1. Wipe the Silicone side of the Facial Interface with an anti-bacterial wipe. Be sure to deeply clean the top of the Facial Interface (which makes contact with the forehead), as well as the bottom-middle areas (which make contact with the cheek bones); these are the key areas where cleaning is pivotal.

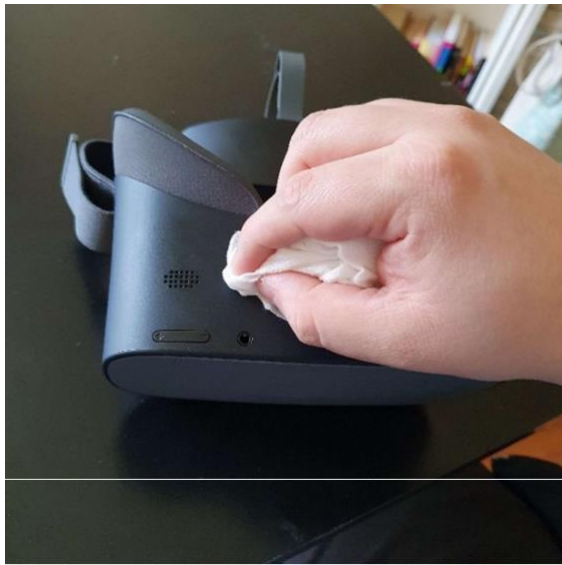

2. Lastly, make sure to deep clean the nose gap section of the Facial Interface.

## CLEANING THE HEADSET

The outside of the headset is mostly plastic and part fabric and can be easily cleaned with an anti-bacterial wipe. The most important area of the headset to clean is the under-side where users breathe onto the headset. **BEFORE** you begin cleaning the headset, please rinse the new anti-bacterial wipe. This will prevent any liquid from dripping into the headset, causing damage.

Be sure to deep clean the nose gap area underneath the headset.

**Note:** Please be careful when cleaning the under-side of the headset not to let any liquid enter the any of the ports or speakers. The charging port, MicroSD card slot, headphone jack and speakers could all be damaged if wet. If you rinsed the wipe beforehand, this should be easily avoidable.
