

Arteco & Flourish: Enhanced Security and Tracking From Seed to Sale

We've seen tremendous evolution in the cannabis market over the last few years, and all signs point toward this expansion continuing from here. For cannabis facilities to keep up with the market expansion and experience success, they must face two prominent challenges: achieving effective security and efficient business operations. The unifying element between these two components is compliance. Though levels of compliance vary by state, strict adherence to both surveillance and reporting regulations creates the need for a strategic approach to the solutions used.

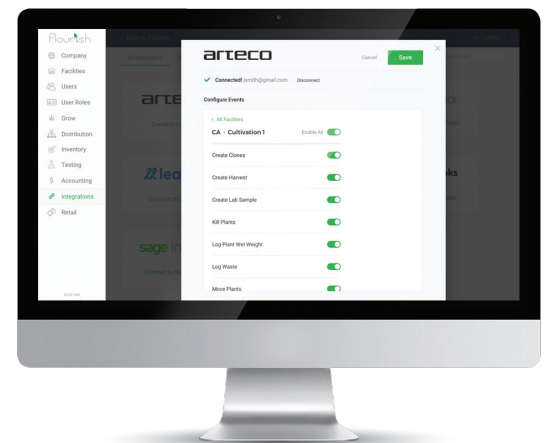

The integration between Arteco and Flourish will allow for complete control over the most important technologies for compliance in the cannabis market: video security, seed-to-sale tracking and inventory package movement/storage.

Arteco Video Event Management Software (VEMS)

Empowers facilities to make sense of a vast amount of video data, making 24/7 monitoring less cumbersome, by unifying alarms and notifications from multiple devices and systems into a single, intuitive interface.

Flourish Seed-to-Sale Software

Flourish Software is a leading technology provider of enterprise supply chain and inventory management systems built for the cannabis industry. Flourish currently serves cultivators, manufacturers, processors, wholesalers, distributors and retailers. Flourish is integrated with state compliance systems so cannabis operators remain compliant while they capture critical business data, operate more efficiently, track product from seed to sale, manage operations, and leverage advanced analytics.

How They Work Together

- Through Arteco Open Connector, the Flourish software can send events when a plant is scanned in the system and associate this event with video from a specific camera to the event metadata, such as:
 - Inventory** Item/product, quantity, location, plant information and more
 - Receiving** Purchase order, vendor, receipt scan and more
 - Outbound** Packages, order details and shipment information
 - Integrations** Environmental control such as temperature, humidity, etc. and RFID scans to update plant statuses, etc. as designed
- Each data point is searchable in the Arteco VEMS and therefore easily retrievable for more information or investigative purposes.
- A facility map can detail all security, tracking and environmental controls, providing real-time alert notifications from all connected devices.

The collaboration between Arteco and Flourish enables facility managers in the cannabis market to improve security, monitoring and business operations in a highly efficient and streamlined manner.
